

Spout Extender Kit #7610SE

Mounting Instructions

(To be used with Wall Mounting Brackets 7570WB)

Purpose:

The **Spout Extender Kit** adds another feature to the **Git'Um Fed Automated Animal Feeder**, making it possible for the Feeder to deliver food *through* a vertical wall, fence or partition into a feed bin, tub, or trough on the other side. This prevents damage to the Feeder from larger animals and eliminates the need to enter the space where animals are being kept to service the Feeder.

The **Spout Extender Kit** contain a special hose and clamp which is to be used with the standard **Wall Bracket Kit** (7570WB) available for mounting the Feeder to a vertical surface.

Instructions:

Refer to the pictures included to become familiar with how the Feeder will look when mounted correctly.

If the Feeder is new and unassembled, refer to the Quick Assembly Instructions to attach the motor and install the Auger Assembly. Attach the Wall Brackets to the Feeder Housing, long side across the Feeder bottom and short side down on the Spout side. With the clamp provided, attach the Spout Extender hose, the end pointing away from the Feeder. Tighten the clamp.

Determine where the Feeder will be mounted. Make a hole if necessary through any wall for

the Spout to pass through and attach the Feeder to the vertical surface with suitable hardware. Finish assembly of the Feeder.

If the Feeder is already being used, (mounted on the Stand or mounted with the Wall Brackets to a vertical surface), disassemble the unit far enough to mount the Wall Brackets as described above and then attach it to the wall, partition or fence where it will be used, as described above.
